

# ACIDIFICATION

*Meaning: Acidification is the process by which a substance, particularly water, becomes more acidic, often due to the absorption of carbon dioxide, leading to detrimental effects on ecosystems, such as marine environments.*

1. Acidification of the oceans poses a significant threat to marine life.
2. The process of acidification can disrupt the delicate balance of ecosystems.
3. Researchers are studying the long-term effects of soil acidification on crop yields.
4. Increased carbon dioxide levels contribute to the acidification of freshwater bodies.
5. Acidification can lead to the dissolution of coral reefs, impacting biodiversity.
6. The acidification of lakes has been linked to the decline of fish populations.
7. Monitoring acidification is crucial for environmental conservation efforts.
8. The industrial emissions are a major factor in the acidification of the atmosphere.
9. Efforts to reduce acidification include implementing stricter pollution regulations.
10. Public awareness campaigns are essential to address the challenges of acidification.
