

ANION

Meaning: An anion is a negatively charged ion formed when an atom gains one or more electrons.

1. An anion is created when an atom gains one or more electrons.
2. In a salt solution, the sodium ions are cations while the chloride ions are anions.
3. The negatively charged anion plays a crucial role in chemical reactions.
4. Anions can be found in various compounds, including acids and bases.
5. During electrolysis, anions migrate toward the anode.
6. Different types of anions can affect the properties of the solution.
7. Understanding anions is essential in fields such as chemistry and biochemistry.
8. The formation of anions often results from the ionization of acids.
9. Anions can influence the conductivity of a solution significantly.
10. In ionic compounds, the balance between cations and anions is vital for stability.
