

BACULINE

Meaning: Baculine refers to a type of viral structure or protein associated with baculoviruses, often studied in relation to insect species and their biological processes.

1. The researcher specialized in the baculine structure of various insect species.
2. During the experiment, they observed a significant increase in baculine production.
3. Baculine proteins play a crucial role in the immune response of certain organisms.
4. The scientist presented her findings on the baculine pathway at the international conference.
5. Understanding the baculine mechanism could lead to advancements in biotechnology.
6. The detailed analysis revealed unexpected interactions within the baculine family.
7. Students in the lab were excited to learn about the functions of baculine proteins.
8. The discovery of a new baculine variant opened up new avenues for research.
9. A thorough examination of the baculine components was necessary for accurate results.
10. Biologists are increasingly focused on the applications of baculine studies in medicine.
