

CALCAREO-ARGILLACEOUS

Meaning: Calcareo-argillaceous refers to soil or sediment that is composed primarily of calcium carbonate (lime) and clay, often influencing agricultural practices and geological characteristics.

1. The geological survey revealed that the region was predominantly calcareo-argillaceous.
2. Farmers in the area have adapted their planting techniques to account for the calcareo-argillaceous soil.
3. Researchers studied the calcareo-argillaceous composition to better understand its impact on local vegetation.
4. The calcareo-argillaceous layers in the sedimentary rock provided valuable information about past environmental conditions.
5. During the excavation, they discovered a calcareo-argillaceous stratum rich in fossilized remains.
6. The engineer recommended using calcareo-argillaceous materials for improved drainage in the construction project.
7. Calcareo-argillaceous deposits can significantly influence the water retention capabilities of the land.
8. In the laboratory, samples of the calcareo-argillaceous earth were analyzed for mineral content.
9. The presence of calcareo-argillaceous formations indicated a history of both marine and terrestrial influences.
10. Understanding the properties of calcareo-argillaceous soil is essential for effective agricultural practices in the region.
