

# CALORIFICATION

*Meaning: Calorification is the process of generating heat from various sources, essential for transforming materials into usable products.*

1. Calorification refers to the process of heat generation from various sources.
2. The calorification of the material was essential for its transformation into a usable product.
3. Researchers are studying the calorification effects of different fuels in energy production.
4. Calorification plays a crucial role in the efficiency of thermal power plants.
5. The team focused on optimizing the calorification process to reduce waste.
6. Understanding calorification can lead to advancements in sustainable energy technologies.
7. The calorification of the soil can influence agricultural productivity significantly.
8. Innovations in calorification methods could revolutionize the industry.
9. Calorification often involves complex chemical reactions that release energy.
10. The concept of calorification is vital in the field of thermodynamics.
