

CHEMOSIS

Meaning: Chemosis is the swelling of the conjunctiva (the membrane covering the eye) due to fluid accumulation, often caused by allergies or irritation.

1. Chemosis can occur as a result of an allergic reaction to certain medications.
2. The doctor explained that chemosis might lead to discomfort and swelling around the eye.
3. In cases of severe conjunctivitis, chemosis can often be observed.
4. Patients with chemosis should avoid rubbing their eyes to prevent further irritation.
5. The presence of chemosis can indicate underlying issues with the eye's health.
6. During the examination, the ophthalmologist noted the patient's chemosis had worsened.
7. Chemosis may be seen in individuals suffering from seasonal allergies.
8. The treatment for chemosis usually involves addressing the underlying cause.
9. Eye drops prescribed for chemosis can help reduce inflammation and swelling.
10. Observing chemosis in a patient can prompt further investigation into their overall health.
