

CHYME

Meaning: Chyme is a semi-liquid substance formed in the stomach by the mixing of food with digestive juices, which is then passed into the small intestine for further digestion.

1. The stomach gradually mixes food with digestive juices to form a semi-liquid substance known as chyme.
2. After the meal, the chyme is pushed into the small intestine for further digestion and nutrient absorption.
3. The consistency of chyme is crucial for efficient enzyme action during the digestive process.
4. In medical studies, the analysis of chyme can provide insights into a patient's digestive health.
5. Chyme plays a vital role in the transition from digestion to nutrient absorption in the gastrointestinal tract.
