COADAPTATION

Meaning: Coadaptation is the process by which two or more species evolve in response to each other, leading to mutual adaptations that enhance their survival and ecological relationships.

1. Coadaptation between species often leads to unique evolutionary traits that enhance their survival.
2. The concept of coadaptation highlights the intricate relationships formed within ecosystems.
3. Through coadaptation, mutualistic species develop traits that benefit both parties involved.
4. Researchers study coadaptation to better understand how organisms influence each other's evolution.
5. In changing environments, coadaptation can play a crucial role in the resilience of species.
