

CONVECTIVE

Meaning: Convective refers to the movement of heat and fluids, particularly in the atmosphere, driven by temperature differences that create currents and contribute to weather phenomena.

1. The convective currents in the atmosphere play a crucial role in weather patterns.
2. Scientists studied the convective processes that lead to the formation of thunderstorms.
3. During the summer, convective heating often results in rapid temperature increases during the day.
4. The convective model provided accurate predictions for storm development in the region.
5. In certain climates, convective activity can lead to the creation of localized rain showers.
