

CORALLITE

Meaning: Corallite: a small, cup-like skeletal structure produced by individual coral polyps, essential for the growth and stability of coral reefs.

1. The corallite structure plays a crucial role in the growth and stability of coral reefs.
2. Scientists analyze the corallite morphology to understand the health of coral species.
3. Each corallite is surrounded by a calcium carbonate skeleton that supports the coral polyp.
4. Variations in corallite size can indicate environmental changes affecting coral ecosystems.
5. The intricate design of corallites contributes to the overall biodiversity of marine habitats.
