

DEFLECTION

Meaning: Deflection is the degree to which an object bends or changes direction under force or influence, particularly in response to load or external conditions.

1. The deflection of the beam under heavy load was measured to ensure structural integrity.
2. During the experiment, the scientist observed how the deflection of light changed with varying angles.
3. The deflection of the soccer ball surprised the goalkeeper, leading to an unexpected goal.
4. Engineers need to account for the deflection of materials when designing bridges and buildings.
5. The athlete's technique improved, resulting in less deflection of the javelin during throws.
