

DEFLECTIONIZATION

Meaning: Deflectionization refers to the process or theory of managing and optimizing the bending or deformation of structures, particularly in engineering applications such as structural and aerospace design.

1. The engineer presented a compelling theory on deflectionization in structural design.
2. In the context of aerospace engineering, deflectionization plays a crucial role in optimizing wing performance.
3. Researchers are exploring the deflectionization of materials to improve their resilience under stress.
4. The concept of deflectionization can significantly impact the safety assessments of major construction projects.
5. Understanding deflectionization is essential for developing more efficient and safer transportation systems.
