

DENITRATION

Meaning: Denitration is the biological or chemical process of reducing nitrates or nitrites to nitrogen gas, thereby removing excess nitrogen from ecosystems and improving water quality.

1. Denitration is a crucial process in the nitrogen cycle, helping to maintain ecological balance.
2. The researchers focused on denitration as a means to improve water quality in agricultural runoff.
3. Understanding denitration can aid in developing strategies to mitigate climate change effects.
4. In wastewater treatment, denitration reduces harmful nitrogen compounds before they enter natural water bodies.
5. The effectiveness of denitration methods varies significantly depending on environmental conditions.
