

DENITRIFY

Meaning: Denitrify: to convert nitrates into nitrogen gas or other nitrogen compounds, thereby reducing nitrogen levels in soil or water, often enhancing fertility or reducing pollution.

1. The process of denitrifying soil helps to improve its fertility by releasing nitrogen back into the ecosystem.
2. Scientists are researching ways to enhance the ability of certain bacteria to denitrify polluted waters effectively.
3. Farmers may need to implement strategies that denitrify their fields to reduce nitrogen runoff into nearby rivers.
4. The denitrify stage in the nitrogen cycle is crucial for maintaining the balance of nutrients in the environment.
5. By promoting denitrification, we can mitigate the impacts of excess nitrogen on aquatic ecosystems.
