

DEPHOSPHORIZATION

Meaning: Dephosphorization is the process of removing phosphorus from steel or iron to improve its quality and properties.

1. Dephosphorization is a critical process in the treatment of steel to enhance its quality.
2. The researchers focused on the effectiveness of various methods for dephosphorization in iron production.
3. In the context of wastewater treatment, dephosphorization can significantly reduce environmental impact.
4. Recent studies have explored new chemical agents that can improve the efficiency of dephosphorization.
5. Understanding the mechanisms behind dephosphorization can lead to advancements in metallurgical engineering.
