

DERMOSKELETON

Meaning: Dermoskeleton refers to a supportive and protective layer of tissue found in certain aquatic organisms, particularly fish, that provides structural integrity and aids in their overall health.

1. The dermoskeleton of certain fish species provides both protection and structural support.
2. Researchers are studying how the dermoskeleton contributes to the overall health of marine organisms.
3. In some invertebrates, the dermoskeleton plays a crucial role in locomotion and habitat adaptation.
4. The complexity of the dermoskeleton varies significantly among different animal phyla.
5. Understanding the dermoskeleton can offer insights into evolutionary adaptations in various species.
