

DIATHERMOMETER

Meaning: A diathermometer is an instrument used to measure the temperature of tissues or biological samples, particularly in medical and laboratory settings.

1. The diathermometer is essential for accurately measuring tissue temperature during surgical procedures.
2. In the laboratory, researchers often rely on a diathermometer to monitor the heat generated in biological samples.
3. To ensure patient safety, the diathermometer must be calibrated regularly to maintain its accuracy.
4. A diathermometer can provide real-time feedback on thermal changes during physical therapy sessions.
5. Innovations in diathermometer design have led to more precise measurements in clinical settings.
