

# DIHEDRAL

*Meaning: Dihedral refers to the angle formed between two intersecting planes in geometry.*

1. The dihedral angle between the two planes of the crystal structure is crucial for determining its properties.
2. In geometry, a dihedral is formed by two intersecting planes, creating an angle that can be measured.
3. Architects often consider the dihedral angles of their designs to ensure aesthetic balance and structural integrity.
4. The molecular geometry of certain compounds is influenced by the dihedral angles between their constituent atoms.
5. Understanding the concept of dihedral angles can enhance one's appreciation of three-dimensional art forms.
