

DIPHTHONGIZATION

Meaning: Diphthongization is the phonetic process by which a single vowel sound evolves into a complex vowel sound that glides from one vowel to another within the same syllable.

1. Diphthongization occurs frequently in the evolution of languages, transforming simple vowels into complex sounds.
2. The phonetic phenomenon of diphthongization can significantly alter the pronunciation of words over time.
3. Linguists study diphthongization to understand the shifts in vowel sounds across different dialects.
4. In some accents, diphthongization leads to a more pronounced difference between the sounds of similar vowels.
5. Children often undergo diphthongization in their speech as they learn to articulate complex sounds.
