

DIPHYGENIC

Meaning: Diphygenic refers to the evolutionary process in which species originate from two distinct ancestral lines.

1. The concept of diphygenic evolution explains how species can arise from different ancestral lines.
2. In biology, diphygenic traits highlight the complexity of evolutionary paths taken by organisms.
3. Researchers studied diphygenic relationships to better understand the genetic diversity within a species.
4. The diphygenic model of development suggests that different environmental pressures can lead to varied adaptations.
5. Understanding diphygenic patterns can illuminate the ways in which species diversify over time.
