

DIVARICATOR

Meaning: Divaricator: a surgical instrument used to separate or hold apart body parts, such as tissues or gums, during medical procedures.

1. The dentist used a divaricator to carefully separate the patient's gums during the procedure.
2. In advanced surgical techniques, a divaricator is essential for creating enough space to access the underlying tissues.
3. The veterinarian employed a divaricator to facilitate a clearer view of the surgical site in the animal's mouth.
4. During the dissection, the students learned how to properly use a divaricator to enhance their visibility of the structures.
5. The tool, known as a divaricator, is often utilized in both medical and dental practices for its ability to hold tissues apart.
