

ENDOPLASMA

Meaning: Endoplasma is the gel-like substance within a cell's cytoplasm that facilitates the functioning of organelles and supports various cellular processes.

1. The endoplasma plays a crucial role in cellular processes by providing a medium for organelles to function.
2. Researchers have discovered new properties of endoplasma that could lead to advancements in cellular biology.
3. In certain amoebas, the movement of endoplasma is essential for their locomotion and feeding.
4. The study of endoplasma has revealed insights into the organization of the cytoplasm in eukaryotic cells.
5. Endoplasma can be influenced by various factors, including temperature and nutrient availability.
