

EPIPHRAGM

Meaning: Epiphragm: a protective barrier or covering, particularly in mollusks, that helps prevent desiccation during dormancy.

1. The epiphragm of the mollusk serves as a protective barrier during periods of dormancy.
2. Researchers studied the epiphragm's role in preventing desiccation in terrestrial snails.
3. When the weather turns dry, the snail secretes an epiphragm to seal its shell.
4. Understanding the formation of the epiphragm can provide insights into the survival strategies of certain species.
5. The intricate structure of the epiphragm varies significantly among different gastropod species.
