

ERYTHRISM

Meaning: Erythrism is a genetic condition in animals characterized by an abnormal increase in red or reddish pigmentation.

1. Erythrism in animals often results in vibrant red or reddish hues that can be quite striking.
2. The rare genetic condition known as erythrism can affect various species, leading to unusual pigmentation.
3. Naturalists observed erythrism in the population of frogs, noting the increased visibility to predators.
4. Erythrism is sometimes confused with albinism, but it specifically relates to red pigmentation rather than a lack of color.
5. The study of erythrism contributes to our understanding of genetic variation and adaptation in wildlife.
