ESCHAR

Meaning: Eschar is a dry, necrotic tissue that forms on the surface of a wound, often associated with burns or infections.

1. The doctor examined the eschar on the patient's leg to assess the severity of the burn.
2. In cases of necrotizing fasciitis, the presence of eschar can indicate tissue death and infection.
3. The nurse carefully cleaned the eschar to promote healing and prevent further complications.
4. After the injury, a thick eschar formed over the wound, signaling the body’s natural healing response.
5. Eschar therapy has gained popularity in treating chronic wounds due to its effectiveness in promoting regeneration.
6. The surgeon carefully examined the eschar on the patient's leg to assess the extent of the wound.
7. After the burn, an eschar formed over the damaged skin, requiring specialized care to promote healing.
8. In a clinical setting, the presence of eschar can indicate a need for more aggressive treatment options.
9. The eschar was dark and crusty, a sign of necrosis that needed immediate attention.
10. He learned that proper management of eschar is crucial to prevent infection and facilitate recovery.
