

ESCHARA

Meaning: Eschar is a dry, dark, necrotic tissue that forms on the skin as a result of injury or disease, often indicating tissue death.

1. The ancient medical texts referred to the eschara as a crucial indicator of tissue necrosis.
2. In the context of wound care, recognizing an eschara can guide treatment decisions.
3. During the examination, the doctor noted the presence of eschara on the patient's leg, signaling a deeper issue.
4. Escharas are often associated with burns, where they form as the skin layers die and harden.
5. Understanding the characteristics of an eschara is essential for effective surgical intervention.
