ESTHESIOMETER

Meaning: Esthesiometer: a device used to measure sensory nerve function and the threshold of tactile sensation in clinical and research settings.

1. The esthesiometer is commonly used to assess sensory nerve function in clinical settings.
2. In research studies, the esthesiometer can help determine the threshold of tactile sensation in patients.
3. Medical professionals often rely on the esthesiometer to diagnose conditions related to nerve damage.
4. Using an esthesiometer, the doctor measured the patient's response to light touch across various skin areas.
5. The esthesiometer provides precise measurements that enhance our understanding of sensory perception.
