

EXOGENETIC

Meaning: Exogenetic refers to influences or factors that originate from outside an organism, particularly in the context of biological evolution and genetic material.

1. The concept of exogenetic influences is crucial in understanding how external factors shape biological evolution.
2. Researchers are exploring exogenetic sources of genetic material that could impact species adaptation.
3. In geology, exogenetic processes refer to those changes that occur at the Earth's surface due to external forces.
4. The study of exogenetic factors in climate change helps scientists predict future ecological impacts.
5. Exogenetic theories challenge the notion that all genetic variation arises solely from within a species.
