

EXOPHTHALMIA

Meaning: Exophthalmia is a medical condition characterized by the abnormal protrusion of the eyeballs, often linked to thyroid disorders.

1. Exophthalmia is often associated with thyroid eye disease, causing a noticeable protrusion of the eyes.
2. Patients with exophthalmia may experience discomfort and visual disturbances due to the pressure on the optic nerve.
3. The diagnosis of exophthalmia typically involves a thorough eye examination and imaging studies.
4. In severe cases, exophthalmia can lead to complications such as corneal exposure or vision loss.
5. Treatment options for exophthalmia may include medication, radiation therapy, or surgical intervention, depending on the underlying cause.
