

EXOPHTHALMY

Meaning: Exophthalmia is a medical condition characterized by the abnormal protrusion of the eyeballs, often linked to hyperthyroidism.

1. Exophthalmia is often associated with hyperthyroidism, particularly in conditions like Graves' disease.
2. The patient's prominent eyes were a clear sign of exophthalmia, prompting further medical evaluation.
3. Treatment for exophthalmia can include medication to manage the underlying thyroid condition.
4. In some severe cases, surgical intervention may be necessary to alleviate the pressure caused by exophthalmia.
5. Doctors often monitor exophthalmia closely, as it can indicate changes in thyroid hormone levels.
