

EXTRAARTICULAR

Meaning: Extraarticular refers to structures or injuries that occur outside of a joint, not involving the joint itself.

1. The injury was primarily extraarticular, indicating that the joint itself was not damaged.
2. Extraarticular structures play a crucial role in stabilizing the knee during movement.
3. In some cases, extraarticular pain may stem from muscle strain rather than joint issues.
4. The surgeon decided to focus on the extraarticular ligaments to enhance recovery outcomes.
5. Understanding the difference between intraarticular and extraarticular injuries is essential for accurate diagnosis.
