

FLOCCILLATION

Meaning: Floccillation is the process of particles clumping together to form flocs, often observed in solutions during chemical reactions or changes in conditions.

1. The scientist noted the flocculation of particles in the solution as he adjusted the pH levels.
2. During the experiment, the floccillation of the sediment indicated a possible chemical reaction occurring.
3. The artist used the concept of flocculation to inspire her abstract painting, representing the merging of different elements.
4. In environmental studies, flocculation plays a crucial role in the treatment of wastewater to remove contaminants.
5. Floccillation can often be observed in natural water bodies where organic matter settles and aggregates over time.
