

FLUORESCENCE

Meaning: Fluorescence is the emission of light by a substance that has absorbed light or other electromagnetic radiation, often used in biological research to visualize structures such as proteins.

1. Fluorescence is commonly used in biological research to visualize proteins within cells.
2. The scientist observed a bright fluorescence when she illuminated the sample with ultraviolet light.
3. In certain minerals, fluorescence can create stunning displays of color under specific lighting conditions.
4. The discovery of fluorescence in jellyfish has led to advancements in medical imaging technologies.
5. Fluorescence microscopy allows researchers to study cellular processes in real time with remarkable clarity.
