

GALENA

Meaning: Galena is a mineral composed of lead sulfide, characterized by its metallic luster and high lead content, commonly mined for its use in lead production.

1. Galena is often sought after by miners for its high lead content.
2. The shimmering, metallic luster of galena makes it a striking mineral in any collection.
3. In geology classes, students learn about the formation and properties of galena.
4. Galena deposits are commonly found in sedimentary rocks and hydrothermal veins.
5. The extraction of lead from galena has been a critical process in industrial applications.
