

# GRAPTOLITIC

*Meaning: Graptolitic refers to fossils or formations related to graptolites, which are extinct colonial marine organisms that lived during the Paleozoic era and are used as important index fossils in geological studies.*

1. The graptolitic fossils found in this region provide valuable insight into the Cambrian period.
2. Researchers discovered a new graptolitic species that could change our understanding of ancient marine ecosystems.
3. The study of graptolitic sediments has revealed significant information about past climate conditions.
4. Geologists often use graptolitic stratigraphy to date rock layers accurately.
5. The unique characteristics of graptolitic organisms make them essential for biostratigraphic correlation.
