

HAEMODYNAMICS

Meaning: Haemodynamics is the study of blood flow and the forces involved in circulation within the cardiovascular system.

1. Haemodynamics is a crucial aspect of cardiovascular physiology that helps in understanding blood flow and pressure changes.
2. Researchers are exploring the effects of exercise on haemodynamics to improve heart health in aging populations.
3. Clinicians often use ultrasound to assess haemodynamics in patients with suspected heart conditions.
4. Abnormal haemodynamics can lead to various complications, including heart failure and hypertension.
5. The study of haemodynamics has advanced significantly with the development of non-invasive measurement techniques.
