

HANDFISH

Meaning: Handfish are a type of fish characterized by their distinctive use of pectoral fins for movement and typically found in shallow coastal waters.

1. The handfish is a unique species known for its unusual mode of locomotion using its pectoral fins.
2. Researchers have observed that handfish tend to inhabit shallow coastal waters, making them vulnerable to habitat loss.
3. Conservation efforts are underway to protect the handfish, which is considered critically endangered.
4. In marine biology classes, students often find the handfish fascinating due to its distinct appearance and behavior.
5. Despite their name, handfish do not actually use their fins like hands; they glide gracefully along the ocean floor.
