

HEMIHEDRAL

Meaning: Hemihhedral refers to a crystal or geometric structure that exhibits symmetry by having half of its faces or features, often resulting in unique optical or aesthetic properties.

1. The crystal exhibits a hemimedral structure, enhancing its unique optical properties.
2. In geometry, a hemipedial shape often leads to intriguing discussions about symmetry and form.
3. Researchers discovered a hemihhedral form in the mineral sample, sparking interest in its formation process.
4. The artist chose a hemihhedral design for the sculpture, emphasizing balance and asymmetry.
5. Understanding hemihhedral angles is crucial for advanced studies in crystallography and material science.
