

HEMIHOLOHEDRAL

Meaning: Hemiholohedral refers to a type of crystal form that exhibits half the symmetry of a holohedral form, resulting in distinct geometrical and optical characteristics.

1. The hemiholohedral form of the crystal structure revealed unique optical properties under polarized light.
2. Researchers discovered a hemiholohedral variant in the mineral that had not been documented before.
3. To fully understand the hemiholohedral geometry, one must analyze both its symmetry and topology.
4. In geometry, a hemiholohedral shape is one that exhibits half the symmetry of its corresponding holohedral counterpart.
5. The artist incorporated hemiholohedral designs in his sculptures, blending mathematics with visual aesthetics.
