

HMATOLYSIS

Meaning: Hemolysis is the breakdown or destruction of red blood cells, leading to the release of hemoglobin into the bloodstream.

1. Hemolysis can be a critical factor in diagnosing various blood disorders, including hemolytic anemia.
2. The lab report indicated that the patient's blood sample showed signs of hemolysis due to an underlying autoimmune condition.
3. Intravenous drug administration can sometimes lead to hemolysis, necessitating close monitoring of blood parameters.
4. In cases of severe hemolysis, the body may struggle to replace lost red blood cells quickly enough, leading to fatigue and weakness.
5. Research is ongoing to better understand the mechanisms behind hemolysis and its implications for treatment strategies.
