

# HYDROFLUORIC

*Meaning: Hydrofluoric refers to a compound or acid containing fluorine and hydrogen, particularly known for its ability to etch materials and its hazardous nature when in contact with skin.*

1. Hydrofluoric acid is used in industrial applications for etching glass and metal surfaces.
2. Because hydrofluoric can penetrate skin and cause severe burns, safety precautions are essential when handling it.
3. The chemical properties of hydrofluoric make it a valuable reagent in organic chemistry.
4. Workers must wear protective gear when working in environments where hydrofluoric is present.
5. Hydrofluoric is highly toxic and can produce harmful fumes that are dangerous to inhale.
