

HYPAPOPHYSIS

Meaning: Hypapophysis is a bony projection on the ventral side of a vertebra, particularly prominent in reptiles, that provides structural support and may influence locomotion.

1. The hypapophysis serves as an important structural feature in the vertebrae of many reptiles.
2. Researchers are studying the role of the hypapophysis in the locomotion of certain terrestrial animals.
3. In some fish species, the hypapophysis provides attachment points for muscles involved in swimming.
4. The evolution of the hypapophysis has implications for understanding the adaptability of vertebrates.
5. Anomalies in the development of the hypapophysis can lead to spinal deformities in some species.
