

HYPERAPOPHYSIS

Meaning: Hyperapophysis refers to an anatomical structure in vertebrates, characterized by an elongated or pronounced process on a vertebra that may aid in locomotion or other functions.

1. The term 'hyperapophysis' is often used in discussions about vertebrate anatomy.
2. Researchers observed a notable hyperapophysis in the specimen, suggesting an adaptation for better locomotion.
3. In paleontology, the identification of hyperapophysis can provide insights into the evolutionary history of certain species.
4. The presence of hyperapophysis in this fossilized skeleton indicates a possible increase in muscle attachment areas.
5. Studying the hyperapophysis can reveal important information about the biomechanics of extinct animals.
