INTERGLOBULAR

Meaning: Interglobular refers to the spaces or structures within a tissue that exist between globules or cells, facilitating processes such as nutrient exchange and cellular communication.

1. The interglobular spaces in the bone tissue serve as important sites for nutrient exchange.
2. Researchers discovered that the interglobular structures play a significant role in cellular communication.
3. In plant biology, interglobular cavities can influence water retention and gas exchange.
4. The formation of interglobular regions is crucial for the synthesis of certain types of proteins.
5. Histological analysis revealed that interglobular areas are often associated with increased metabolic activity.
