

INTERPOLATOR

Meaning: An interpolator is a mathematical tool or algorithm used to estimate unknown values by constructing new data points within the range of a discrete set of known data points.

1. The interpolator effectively filled in the gaps between the existing data points.
2. Using an advanced interpolator, the researchers were able to generate a more accurate model of the climate changes.
3. In computer graphics, the role of the interpolator is crucial for rendering smooth transitions between frames.
4. The software includes a powerful interpolator that can handle both linear and nonlinear datasets.
5. An efficient interpolator can significantly enhance the quality of the visual output in animation.
