

ISOLATOR

Meaning: Isolator: a device or system designed to separate or isolate components to prevent interference or unwanted influence.

1. The isolator in the electrical circuit prevents any unwanted current from affecting the system.
2. In the laboratory, the scientist used an isolator to ensure that external variables did not interfere with the experiment.
3. To improve safety, the technician installed an isolator to separate the high-voltage equipment from the control panel.
4. During the training session, the instructor emphasized the importance of using an isolator to protect sensitive components.
5. The audio engineer relied on a high-quality isolator to eliminate feedback and enhance sound clarity during the recording.
