ISOPRENE

Meaning: Isoprene is a volatile organic compound that serves as a fundamental precursor in the synthesis of synthetic rubber and is emitted by plants, affecting atmospheric conditions.

1. Isoprene is a key building block in the production of synthetic rubber.
2. The release of isoprene from trees can influence local air quality and climate.
3. Scientists are studying the role of isoprene in the biosynthesis of natural compounds.
4. Due to its unsaturated structure, isoprene can undergo various chemical reactions.
5. Isoprene emissions from vegetation are significant contributors to atmospheric chemistry.
