

LHERZOLITE

Meaning: Lherzolite is a type of ultramafic rock composed mainly of olivine and pyroxene, commonly found in the Earth's upper mantle and used by geologists to study geological processes.

1. Lherzolite is often found in the Earth's upper mantle, providing insights into its composition.
2. Geologists study lherzolite to understand the processes that shape our planet's geology.
3. The mineral composition of lherzolite typically includes olivine, pyroxene, and garnet.
4. Lherzolite can be a key indicator of volcanic activity when it is brought to the surface.
5. Recent research has revealed new details about the stability of lherzolite at various depths within the mantle.
