

LITHOCLAST

Meaning: Lithoclast: a tool or device used in medical procedures to break up stones, particularly kidney stones, or a fragment of rock that has been broken off from a larger mass, often studied in geology.

1. The lithoclast is an essential tool in modern lithotripsy procedures for breaking up kidney stones.
2. Geologists often study the formation of lithoclasts to better understand the processes of erosion and sedimentation.
3. In ancient times, artisans used lithoclasts to carve intricate designs into stone surfaces.
4. The effectiveness of a lithoclast can vary depending on the composition and density of the rock being treated.
5. Researchers are investigating new materials for lithoclasts that could enhance their durability and performance in surgical applications.
