

LITHOPHYLL

Meaning: Lithophyll is a type of calcareous algae that contributes to the structure and texture of marine environments, particularly in coral reef ecosystems.

1. The lithophyll in the aquarium adds a unique texture to the underwater landscape.
2. Many marine biologists study lithophyll to understand its role in coral reef ecosystems.
3. Lithophyll formations can often be found in shallow waters, thriving in rocky environments.
4. The vibrant colors of the lithophyll contrast beautifully with the sand and seaweed.
5. Due to its ability to withstand harsh conditions, lithophyll is a vital component of coastal habitats.
